1. Write a program to convert Fahrenheit to Celsius.

2. Print the powers of 2 up to 1024 using a for loop (only two lines of code)

3. If you enter a search term like "New York weather" in Googles search engine, youll see, among other things, a graph showing the temperature at different times of the present day. Re-create such a graph.

4. Write a python program to find the prime numbers below n.

5. Write a python function to calculate the GCD of two numbers.
